

# Workflow Designer

Provider Manager

Because lot's of tasks require a connection to external providers, we centralized the management of login credentials for this configuration within one clean and secure interface.

If you open the Provider Manager the first time, you see no configured provider.  
In the top right corner you could add a provider and create a new configuration of this type.

The configuration of one connection is stored encrypted inside the database.  
The connections could be chosen in actions, which are already converted to this configuration.
